United States: only men with 13 years or more, no people		6.67

DISCUSSION

A systematic questionnaire study, usually not representative of general practice or other areas, is considered to be a valuable tool for the study of the prevalence of a disorder in a defined population. The results of such studies can be used to estimate the prevalence of a disorder in a defined population, which is defined as the number of people with a disorder in a defined population at a defined time.
